

Class 08: Input and Output, Continued

Held: Wednesday, 8 September 2010

Summary: We continue our exploration of C's primary input and output routines.

Related Pages:

Notes:

- You should have received comments on your assignment 1 this morning. Let me know if you did not.
- Are there questions on assignment 2?
- Note that the due date was changed until Thursday.
- I've rearranged the syllabus slightly. I expected such rearrangements, which is why I included so many "Pause for Breath" days.

Overview:

- Review.
- Lab.

Review

- We learned about `scanf` and `printf`, for reading and for printing.
- We built a program that read in quarts (as an integer) and printed out the corresponding number of liters.
- We found the I/O model a bit strange: Rather than having a read routine that returns the value read, C's standard I/O library relies on a procedure that expects the variables to read into as parameters.
- We discovered that `scanf` returns the number of values read.

Lab

- You are now ready to attempt the lab.
 - Be prepared to reflect.
