

## CSC207.01 2013F, Class 38: Detour: Anonymous Inner Classes

---

### Overview

- Preliminaries.
  - Admin.
  - Questions on HW9.
- Detour: An invariant for merge.
- Anonymous inner classes.
- Lab.

## Preliminaries

### Admin

- I may not have a reading for tomorrow. (Given that I'm mostly booked until 8 pm, it's unlikely.)
- Upcoming extra credit opportunities:
  - G-Tones, Train Opponents, and Noteworthy, 9pm in Bucksbaum Rotunda
  - Town Hall, Wednesday, November 13, noon or 7:30 p.m.
  - Learning from Alumni, Thursday, 2:15: Atul Gupta '88, Trustee
  - CS Extra, Thursday, 4:30: Hilary Mason '00
  - Informal chat with Hilary Mason, Thursday, 8-9 pm, Commons
  - CS Table, Friday, HCI
  - Innovation Class, Friday, 12:45, ARH 302, Hilary Mason '00
  - CLS with Hilary Mason '00, Friday, 4:15-6:30 (I don't know how career connections work)
  - Swim meet, Saturday, noon
  - Digital Commons talk Monday, November 19, 7:00 p.m. or so
  - "Data Sovereignty: The Challenge of Geolocating Data in the Cloud", November 25, 4:15 JRC 101
  - "Gold Fever" by Andrew Sherburne '01 or so, 7:00 p.m., Monday, November 25, ARH 302
  - Tuesday, November 20, 4:15 p.m., JRC 209 a gaming event with the game [d0x3d!]

## Questions on HW9

- Do you want the analysis for HW9?
  - It would be nice, but it's not necessary.
- For the ones that divide by 2, powers of two are good
- Should we use BigDecimal for the calculator?
  - Nah. Just double is fine.

## Detour: An invariant for merge

*Remind me to end by 10:25*

Background:

- Preconditions:
  - The subarray of `a1` from `lb1` (inclusive) to `ub1` (exclusive) is sorted
  - The subarray of `a2` from `lb2` (inclusive) to `ub2` (exclusive) is sorted
- Postconditions:
  - `target` is a permutation of the combination of the two subarrays
  - `target` is sorted
- We will rely on the preconditions to make sure our invariant holds at the beginning of the loop.
- We will try to achieve the postconditions at the end of our loop.

A picture of the state of our system

```
a1:
+-----+-----+-----+-----+
| irrelevant | processed | unprocessed | irrelevant |
+-----+-----+-----+-----+
0           lb1      c1           ub1      a1.length

a2:
+-----+-----+-----+-----+
| irrelevant | processed | unprocessed | irrelevant |
+-----+-----+-----+-----+
0           lb2      c2           ub2      a1.length

target:
+-----+-----+-----+-----+
|           processed           |           "empty"           |
+-----+-----+-----+-----+
0                               i                               target.length
```

Our focus should probably be the processed values in `target`. What can we say about that section? What should we say? (We'll work both formally and informally.)

- `a1` is sorted from `lb1` to `ub1`
- `a2` is sorted from `lb2` to `ub2`
- The "processed" section of `target` is sorted
  - For all  $j, 0 < j < i$ , `order.compare(target[j-1], target[j]) <= 0`
- The "processed" section of `target` is a permutation of the processed sections of `a1` and `a2`.
- All of the "processed" elements of `target` are less than or equal to all of the "unprocessed" elements of `a1` and `a2`.

Is that enough? What's the basic step we expect to do?

Action: Copy the smaller of `a1[c1]` and `a2[c2]` to `target[i]`

```
if (order.compare(a1[c1], a2[c2]) <= 0) {
    target[i++] = a1[c1++];
} else {
    target[i++] = a2[c2++];
} // else: a2[c2] is smaller
```

When do we stop? When we run out of elements in `a1` or `a2`

```
a1:
+-----+-----+-----+
| irrelevant | processed | irrelevant |
+-----+-----+-----+
0           lb1       c1,ub1       a1.length

a2:
+-----+-----+-----+-----+
| irrelevant | processed | unprocessed | irrelevant |
+-----+-----+-----+-----+
0           lb2       c2           ub2       a1.length

target:
+-----+-----+-----+
|           processed           |           "empty"           |
+-----+-----+-----+
0                               i                               target.length
```

Whoops! Haven't quite achieved the postcondition.

- But, we know that everything in `target.processed` is sorted, everything in `a2.unprocessed` is sorted, and everything in `target.processed` is smaller than `a2.unprocessed`, so **COPY THEM OVER!**
